

1. What is this skill?

The Customer Project Status Board is a Claude Code skill that aggregates live data from five sources: SAP Cloud Reporting Portal, ServiceNow ITSM, ServiceNow WCR, Microsoft Calendar, and Microsoft Graph API email. It generates a 7-tab interactive HTML report of your entire cloud implementation portfolio.

Key benefits:

- Eliminates ~38 minutes of daily manual data gathering
- Prioritized TODO list with P1–P4 tiers (Critical to Informational)
- Partner health risk matrix with go-live timeline
- AI-generated meeting prep cards based on live alert data

2. Prerequisites

Required software:

- Claude Code — install from <https://claude.ai/code>
- Node.js LTS — required by Claude Code
- Python 3.x — used by the HTML generator script

Required authentications (first-time only):

- SAP SSO session for the Cloud Reporting Portal
- SAP SSO session for ServiceNow ITSM
- Valid Microsoft Graph API OAuth token (Teams + email access)

Note: Authentications are cached by Claude Code. You only need to re-authenticate when your SAP SSO session expires.

3. Installation

Step 1 — Download the installer

Go to <https://i555758.github.io/ai-skill-installer/> and click **Latest Version (.zip)** on the Customer Project Status Board card.

Step 2 — Extract the ZIP

Right-click the downloaded `instalar_csb_latest.zip` and select **Extract All**. This creates a folder containing `instalar_csb_latest.ps1`.

Step 3 — Run the installer

Right-click `instalar_csb_latest.ps1` and select **Run with PowerShell**.
If a security warning appears, press **R** (Run once) to proceed.

Step 4 — Configure prerequisites (first-time only)

After running the installer, two configurations are required before the skill can access live data:

4a. HPI Cookie — SAP Cloud Reporting Portal

The portal requires an SAP SSO cookie. To obtain it:

1. Open Chrome and go to: <https://reporting.ondemand.com>
2. Log in with your SAP credentials (I-number + password)
3. Press **F12** to open DevTools → Application → Storage → Cookies → <https://reporting.ondemand.com>
4. Find the cookie named `mysapso2` and copy its **Value** (a long string)

Save the cookie in %USERPROFILE%\.claude\settings.json:

If the file does not exist, create it with:

```
{
  "env": {
    "HPI_COOKIE": "mysapso2=PASTE_VALUE_HERE"
  }
}
```

If the file already exists, add "HPI_COOKIE" inside the existing "env" block.

Note: The cookie expires every ~8 hours. Update it when the portal returns an authentication error.

4b. Teams MCP permissions

The Teams MCP tools require explicit permission. The installer creates or updates %USERPROFILE%\.claude\settings.local.json automatically with the required entries. If you see a "Teams MCP needs allow" error, verify that settings.local.json contains:

```
"mcp_sap-msteams__teams_web_calendar",
"mcp_sap-msteams__teams_web_conversations",
"mcp_sap-msteams__teams_web_messages",
"mcp_sap-msteams__teams_web_my_profile",
"mcp_sap-msteams__teams_web_search_people",
"mcp_sap-msteams__teams_web_find_private_chat"
```

What the installer does:

- Creates a backup of your current CSB files (if any)
- Generates a rollback script in case you need to revert
- Installs 9 files: 1 command + 7 skills + generate_html.py
- Shows confirmation and backup path when complete

File	Destination	Purpose
Customer-Project-Status-Board.md	.claude/commands/	Main command definition
csb-00-init.md	.claude/skills/	Initialize session, paths, cache
csb-01-portal.md	.claude/skills/	Fetch SAP Cloud Reporting Portal
csb-02-itsm.md	.claude/skills/	Fetch ServiceNow cases + WCR
csb-03-comms.md	.claude/skills/	Fetch calendar + email (Graph API)
csb-04-crossref.md	.claude/skills/	Cross-reference + alerts + TODO
csb-05-html.md	.claude/skills/	Render 7-tab HTML report
csb-06-finalize.md	.claude/skills/	Log + open browser
generate_html.py	...CSB/data/	HTML generation helper script

4. How to use

Basic invocation:

```
/Customer-Project-Status-Board
```

With customer name filter:

```
/Customer-Project-Status-Board NEOBP0  
/Customer-Project-Status-Board "NEOBPO, Dotz, ADEMICON"
```

Force full refresh (ignore cache):

```
/Customer-Project-Status-Board fresh
```

Interactive mode:

When invoked without arguments, the skill asks: [1] My assigned projects or [2] By customer name.

5. Report structure (7 tabs)

Tab	Name	Content
1	Dashboard	Sortable project table: status, partner, phase, go-live, open cases. CSV export.
2	Next Actions	Per-project action cards sorted by priority (red / yellow / green).
3	Prioritized TODO	Merged TODO list by P1 (Critical) through P4 (Low).
4	Cases and WCR	Open ServiceNow cases with SLA status + WCR pipeline.
5	Partner Health	Composite risk matrix: portal status, weeks to go-live, email recency.
6	Go-Live Timeline	Horizontal timeline sorted by date. Near-term items pulse. Clusters flagged.
7	Meeting Prep	One card per today's meeting: go-live, status, open cases, 3 talking points.

6. Rollback

The installer automatically creates a backup before installing. To revert:

Navigate to: %USERPROFILE%\OneDrive - SAP SE\Presentations\Customer-Project-Status-Board\backups\

Find the folder with the version timestamp and run `rollback_csb_[VERSION].cmd`
